
SCHOTT

Tubular glass photobioreactors

Enabling efficiency

Where others say no, we say yes.

Because at SCHOTT we believe that shared responsibility can release the energy to achieve the impossible. As a global material technology group, we are constantly exploring unique and innovative ways to make a difference for businesses and people. Being a foundation company, SCHOTT has anchored responsibility, scientific research, society and the environment deeply in its DNA. Represented in over 30 countries by 17,400 employees, we are a highly skilled partner for many high-tech industries. Whatever challenges the future might hold, we can't wait to come up with innovative solutions and turn visions into reality.

With a production capacity of round about 230,000 tons and production sites in Europe, South America and Asia, SCHOTT Tubing is one of the world's leading manufacturers of glass tubes, rods and profiles. More than 60 different glass types are produced in a large variety of dimensional and cosmetic specifications based on a standardized production process and a global quality assurance system. SCHOTT Tubing provides customized products and services for international growth markets such as pharmaceuticals and electronics as well as industrial and environmental engineering.

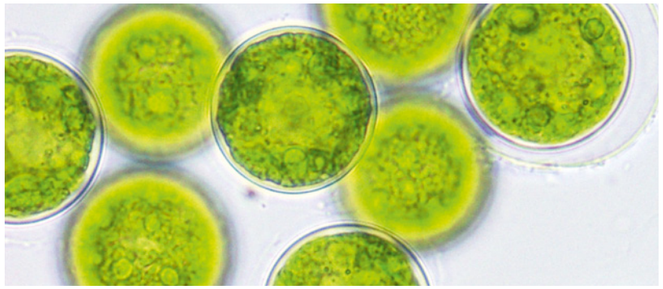
Algae production systems

Common photosynthetic algae cultivation systems are either open ponds or closed photobioreactors (PBRs).



Open ponds
Open ponds are typically built in circular or raceway configurations. The water is kept in motion, for example by paddle wheels. Open ponds are seemingly inexpensive and easy to build. However, poor light utilization, danger of contamination and high water evaporation are the main challenges, which lead to low biomass output per area and large water uptake. Some difficulties can be overcome by rooftops however this increases the costs further.

Closed system
Closed systems are dominated by tubular and flat-plate reactors. Other options are bags, coils or domes. Flat plate systems have received a lot of attention due to their large illuminated surface area, but the technology suffers from heating problems and a strong tendency to build up biofilm formations on the inner walls. Tubular systems on the other hand reduce these drawbacks while maintaining the advantages of optimal light input and high productivity.

Therefore closed tubular glass Photobioreactors (PBRs) with long lifetimes and easy cleanability, are very well suited for the highly reproducible cultivation of algae resulting in the highest possible growth rates. As such, tubular glass PBRs are best suited to provide biosecurity for high quality inoculum used in open ponds.

Crystal clear benefits of closed tubular glass PBR systems

Biosecure
protection against bio-contamination and culture crashes

Cost efficient
little maintenance and low total cost of ownership

Resistant
against chemicals, corrosion, sagging, scratches, UV-light

Productive
80 – 160 l / m² photoactive volume, PBR height up to 6 m

Durable
sustainable light transmission T > 95 % (air – glass – water), lifetime of 50 years and more

Food safe
food and pharma grade

Glass U-bends for algae cultivation must be stored in dry conditions in closed buildings.

Product range

Borosilicate glass manifolds

Fence system

Manifolds and couplings, fence system. © Jongerius ecoduna GmbH

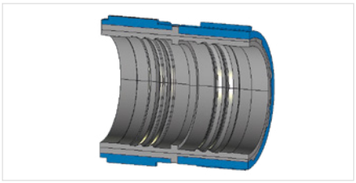
Manifolds are placed at the tops or at the ends of tubular PBR fences and function as U-bends and in- and outlets.

- Biosecure and food safe, full glass solution
- Available with closed ends or with flange
- Outside diameter of arms: 54 mm or 65 mm for use with standard couplings
- Number of arms, distance between arms, total length etc. are customized with a minimum order quantity of 25 pieces

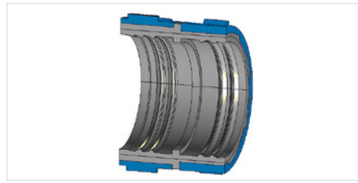
Description *	Package	Package content	Minimum order quantity (MOQ)
Manifolds 10 arms closed 54 mm			25
Manifolds 5 arms flange 54 mm			25
Manifolds 8 arms closed 65 mm			25
Manifolds 4 arms flange 65 mm			25
Manifolds 6 arms open 65 mm	carton pallet	2 36	1 pallet

*closed: both ends closed; flange: one side closed and one side flange; open: both sides flange
Glass manifolds for algae cultivation must be stored in dry conditions in closed buildings.

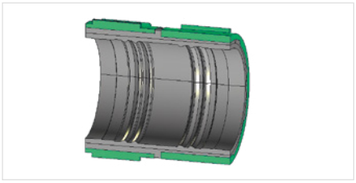
Couplings



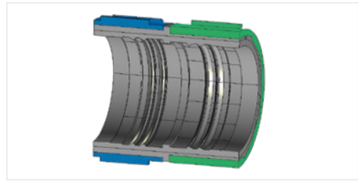
1 Standard, length 80 mm
Partition wall to assure glass separation and smooth transition (torque wrench 40 Nm needed)



2 Standard slim, length 45 mm
(torque wrench 25 Nm needed)



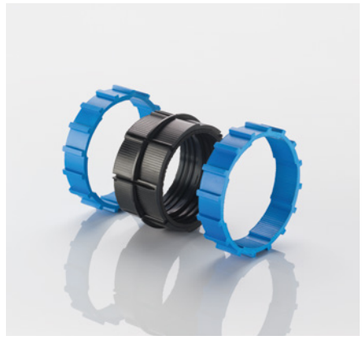
3 Maintenance, length 80 mm
Allows easy exchange of tubes, no partition wall



4 Adapter, length 80 mm
Allows connection to pheriphery tubes with 2.5 in outer diameter

SCHOTT tool kit

Open standard coupling



Open standard slim coupling

Specially developed for tubular photobioreactors:

The couplings are designed for SCHOTT glass tubes with plain tube ends according to the product range shown in this brochure.

- Proven lifetime > 10 years *
- 3 bar pressure resistance
- UV-resistance
- Regular cleaning cycles with various chemicals
- Fast installation allowing for reduced built up time of the reactor
- Easy to disassemble and re-use allowing for fast modification or extension of a reactor system
- Easy handling with pre-assembled devices and a special tool kit including a torque wrench (Standard couplings: 40 Nm, Slim couplings 25 Nm)
- Food grade

*installed in PBR systems since 2014

Item no.	Outside diameter tube mm | in	Package Number of couplings		Description	Package Weight approx. kg approx. lb
1530116	54 | 2.13	24 960	bag pallet	Standard [1]	6.9 | 15.3 277.7 | 612.2

Couplings for algae cultivation must be stored in dry conditions in closed buildings.

Packaging

Bags
- Couplings

Cartons
- Tubes, up to 2.5 m length
- U-bends
- Couplings
- Manifolds

Wooden boxes and special pallets
- Tubes, 5.5 m length
- Smaller quantities

All products from SCHOTT for algae cultivation must be stored in dry conditions in closed buildings. For storing pallets and wooden boxes with glass tubing, the floor must be level and horizontal and have a load-bearing capacity of 1,000 kg / m². Do not stack more than 3 pallets on top of each other.

Borosilicate glass properties

DURAN® glass tubing

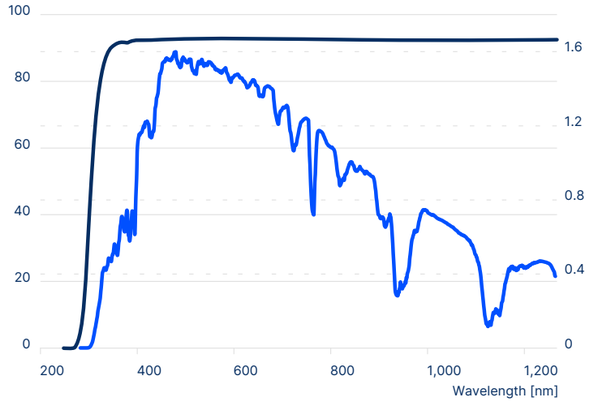
Transmission



Transmission of DURAN® glass (d = 2.2 mm) in configuration air/glass/air.
DURAN® is a registered trademark of DWK Life Sciences GmbH.

Note
When the glass tube is filled with water, the transmission increases from about 92 % to 95.6 % due to reduced reflection losses at the inner glass/water interface.

Pressure resistance of tubing made of borosilicate glass *

The following formulas apply to stress free, pristine tubing and cylindrical hollow bodies with a circular profile, uniform wall thickness with open ends, free from thermal load, under internal positive pressure.

Estimation of the minimum wall thickness (WT)

$$WT = \frac{OD \cdot p}{140\ bar + p}$$

$$\frac{K}{S} = 70\ bar$$

Permissible load referring to standard DIN EN 1595: “Pressure equipment made from borosilicate glass 3.3 – general rules for design, manufacture and testing”

Estimation of the maximum pressure resistance (p)

$$p = \frac{WT \cdot 140\ bar}{OD - WT}$$

OD = Outside Diameter in [mm]
WT = Wall Thickness in [mm]
p = Pressure Resistance in [bar]

Other points to be considered:

- AD 2000-leaflet N 4, edition 2000-10: Pressure vessels made of glass, with encl. 1, edition 2000-10: evaluation of faults in walls of glass pressure containers
- AD 2000-leaflet B 1, edition 2000-10: cylindrical and spherical shells under internal pressure overload

According to DIN EN 1595: “Pressure equipment made from borosilicate glass 3.3 – general rules for design, manufacture and testing”, DURAN® approved material and may be used for the construction of pressure equipment.

*typical values under standard conditions

Pressure drop in tubular photobioreactors

Pressure loss *

In general, the pressure drop can be calculated for any velocity using the following formula.

$$\Delta p = \zeta \cdot \frac{\rho}{2} \cdot u^2$$

Δ p: pressure loss
ζ: pressure loss number (zeta)
ρ: algae culture density
u: linear velocity of algae culture

u = 0,7 m / s	ζ	Δ p [Pa]
Round tube (D = 65 mm, WT = 2.2 mm, L = 5.5 m)	1.96	480
U-bend (D = 65 mm, WT = 2.8 mm)	0.252	62

Pressure drop of a tube and a U-bend at the given velocity, u. D is the outer diameter, WT the wall thickness. The algae culture’s density was approximated with ρ = 1 g / cm³.

*typical values under standard conditions

Electrical power

The electrical power of the pumps, P_{el}, scales with the pressure drop and the volume flow, Q:

$$P_{el} = \frac{\Delta p \cdot Q}{\eta_p}$$

P_{el}: electrical power
Δ p: sum of pressure loss in Pa
Q: volume flow rate in m³ / s
η_p: pump efficiency at operating point ($0 < \eta_p < 1$)

Research done in cooperation with: Institute of Fluid Dynamics, LSTM, Technical Faculty, University Erlangen-Nuremberg, Germany

Features and benefits

Closed tubular photobioreactors versus open ponds

Closed tubular photobioreactor

Open pond

Contamination
- Very low risk of contamination compared to open ponds, where other microorganisms or insects have easy access
- No limitation regarding the algae species that can be grown, also due to effective blocking against competing organisms

Productivity
- Higher productivity in terms of mass per area and day
- Significantly higher volumetric productivity

Algae concentration at harvest
- Notably higher concentration in terms of mass per liter
- More efficient harvesting procedure

Water loss
- No evaporation within closed system compared to open ponds, which can lose significant water amounts, resulting in salinization
- Water loss is limited to external factors, such as the cooling process

Biomass quality
- Biomass quality is highly reproducible due to excellent process control of tubular PBR systems
- High value products or high quality inoculum can be produced with optimum reliability

Production flexibility
- Easy cleanability allowing for defined initial status any time, thus switching algae species is possible and secure

Use of GMO * for improved production process
- GMO production is possible with closed reactor design

*GMO = Genetically Modified Organism

Borosilicate glass versus polymer materials

Light transmission
- Excellent light transmission (see page 14 for details)
- No solarization or browning effect
- No UV-protective additive or coating necessary to secure material properties

Fire protection
- Glass does not burn or give off toxic fumes

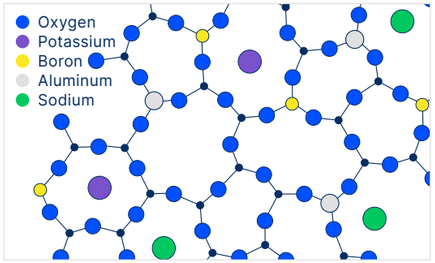
Leaching
- Glass is a chemically highly resistant material. With plastic tubing, depending on the polymer type, monomers or oligomers of hazardous substances such as Bisphenolmolecules can be leached into the algae culture.

Cleaning
- Mechanical stability allows continous in-line cleaning with polymer pellets
- Chemical stability allows cleaning in place (CIP)
- Lower material and maintenance costs compared to quality polymer tubes

Thermal stability
- No need for expansion loops due to low thermal expansion; Example: For 5.5 m long tubes and a temperature increase of 20 °C / 36 °F the expansion of Borosilicate glass is only 0.36 mm / 0.01” while polymers expand from 3.3 – 8.8 mm / 0.13” – 0.35” depending on polymer type.

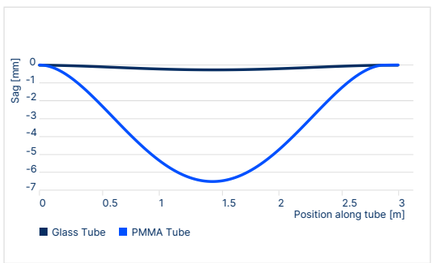
Cost saving
- Glass components can last fifty years and longer
- Reduced number of rack poles. High mechanical stability allows increased support distances without significant sagging of tubes (see picture on right)

Sagging
- No permanent deformation of glass tubes in contrast to polymer tubes



Borosilicate glass

Polymer



Sagging of water filled tubes
(outer diameter 65 mm, wall thickness 2.2 mm, length 2.75 m).
The sag of the glass and polymer tubes is 0.5 mm and 6.6 mm, respectively. The polymer tube would need to be supported every 1.5 m for the same sag as the glass tube.

References of glass tubular photobioreactors

SCHOTT has formed alliances and partnerships all over the world. This allows us to provide complete tubular photobioreactors according to your needs.
